From what I've learned about them, one would connect both battery banks to a common ground, a charging source is connected to the input, one battery bank to output #1 and one battery bank to output #2. The isolator keeps both battery banks completely separate from each other yet allows both to be charged by the same charging source.

The little solar panels attached to the sub-\$50 power banks are a gimmick; they often come with disclaimers like "emergency charging only" because they would take over a week to actually charge the thing. You would be better off buying a separate USB solar panel, along with whatever power bank you want.

These concepts don't just work with batteries, either. Say you have two 12 Volt solar panels but need to charge a 24 Volt battery bank. Follow the same principles to create a 24 Volt panel bank.
