

Off-grid inverters also perform the reverse function, converting AC power from the grid into DC power to charge the batteries. This dual functionality makes them essential for solar power generation systems, which rely on stored solar energy to provide electricity in remote locations such as deserts, mountains, and forests.

Furthermore, I'd be inclined to use an off-grid/hybrid that can pass grid with no grid-feedback and at least get the stuff to pay for itself. If truly as over paneled as stated, \$2000 of LiFePo would run a lot overnight.

We all know it is a big no-no connecting on grid inverters to a basic off-grid AIO (that is incapable of frequency control). But I just wonder about one thing. Let's say one does like the OP. His microinverter produce tiny amount of power 40W and 50W so probably there has always been some load that took care of it. Let's say there wasn't.
