How much energy does Burundi use?

Energy in Burundi is a growing industry with tremendous potential. As of 2020, Burundi consumes a total of 382.70 million kilowatt hours (kWh) of electric energy per year. The country produces locally 69% of the electricity it consumes, with the rest imported from other countries.

Does Burundi have a low generating capacity?

In addition to its low generating capacity, Burundi's energy sector is fraught with a scarcity of technical and management skills impacting the sector's strategic development, effective policy-making and planning and operations of all stakeholders in the energy institutions.

Why does Burundi have a low energy supply?

Most of Burundi's energy supply (95 per cent) comes from hydropower. This high dependence on hydropower makes the country vulnerable to climate extremes such as drought. For instance, during the 2009 and 2011 droughts, electricity supply was reduced by as much as 40 per cent, drastically affecting the economy (REEEP, 2012).

What is Burundi's main energy source?

Its most important power source is hydroelectric power, representing 95% of total production. It also uses energy from other renewable (wind, solar, biomass, and geothermal) and coal power plants. Burundi has the world's lowest carbon footprint per capita at 0.027 tons per capita in CO<sub>2</sub> emissions as of 2019.

How will new power plants affect Burundi?

New hydroelectric power stations at Jiji and Mulembwe with a total capacity of 48 MW are under construction. These new power plants will double Burundi's production capacity, which is currently 39 MW. They will also increase the national electrification rate from 5% to 8% and help to bridge the energy deficit.

What is the energy mix in Burundi?

The energy mix has remained virtually unchanged since 2010. New hydroelectric power stations at Jiji and Mulembwe with a total capacity of 48 MW are under construction. These new power plants will double Burundi's production capacity, which is currently 39 MW.
