

Can Indonesia meet its energy needs by relying on solar energy?

Our previous study shows the country could meet its energy needs by relying on its abundant solar energy. By installing billions of solar panels Indonesia could harvest about 190,000 TWh of solar energy per year. This amount of energy is larger than world's electricity consumption in 2020.

Will solar energy continue to grow in Indonesia?

However, solar energy is predicted to continue to grow massively, in line with the increasing numbers of developing countries' pursuit of renewable energy deployment and the falling costs of solar generation. Indonesia has sufficient technical potential of solar energy to meet its current and future energy needs.

Can Indonesia harness solar energy?

While solar energy capacity is increasing in Indonesia, the current installed capacity is just a fraction of the potential capacity of solar power development. As a nation that straddles the equator, it gets direct, high-intensity solar irradiance, putting it in an ideal position to harness solar energy.

What is the market potential for solar energy in Indonesia?

Also, the market potential for Greater Jakarta and Surabaya amounts to 13% and 19%, respectively. Assuming 2 kWp installation capacity, the numbers equal to 1,1 - 1,2 GWp and 170 - 186 MWp. Not small numbers compared to Indonesia's solar energy target (6,5 GW by 2025).

How much solar energy will Indonesia produce by 2025?

Assuming 2 kWp installation capacity, the numbers equal to 1,1 - 1,2 GWp and 170 - 186 MWp. Not small numbers compared to Indonesia's solar energy target (6,5 GW by 2025). Read more: [Market Analysis of Rooftop Solar in Greater Jakarta and Surabaya \(in Indonesian\)](#), [Market Potential of Rooftop Solar PV in Surabaya \(in English\)](#) 4.

Does Indonesia require rooftop solar?

Indonesia's National Energy Plan (RUEN) also imposes a mandatory use of rooftop solar for government and public buildings: a minimum of 30% of their roof space area.

A wet day is one with at least 0.04 inches of liquid or liquid-equivalent precipitation. The chance of wet days in Jakarta varies very significantly throughout the year. The wetter season lasts 6.3 months, from October 27 to May 4, with a greater than 47% chance of a given day being a wet day. The month with the most wet days in Jakarta is January, with an average of 22.6 days ...

Start laying down solar panels as soon as you can (if going Solar). The steam engines get you through the night and the solar kicks in during the day. Aim to have enough solar panels down to prevent the steam firing up for support during the day. Then you get accumulators and lay them down until you get enough storage to get through the night.

I used a generator bank for my horde night base, but for my main base I used Solar + Battery Banks. In A19 I had a solar panel hooked up to a battery bank that was hooked up to a switch controlled light, a timer controlled light for night time, and a second battery bank which was connected to two motion sensors, and a garage door.

390 day time tics / 330 night time tics = 54% day to night ratio. A T1 solar panel at 100% efficiency produces 20 power during the day, but only 10.8 power when averaged across the day and night. This means wind, with a measly 12 power, is actually more space efficient than solar in non-desert biomes.

David. Corporate Advisor. David Harrison has over 28 years experience in both law and business in Indonesia and Canada. He has provided both legal and business advice on projects in the areas of solar power, solar thermal energy, water production, geothermal energy, geothermal heating/cooling, energy efficiency technologies and sustainable agriculture.
