

Documents for suspending energy storage grid connection

What are the different storage requirements for grid services?

Examples of the different storage requirements for grid services include: Ancillary Services - including load following, operational reserve, frequency regulation, and 15 minutes fast response. Relieving congestion and constraints: short-duration (power application, stability) and long-duration (energy application, relieve thermal loading).

What do I need to know about a national grid connection?

Start time of test. Module Active Power. System Frequency. Droop setting of controller if applicable. There are a number of different departments within National Grid that will be involved with this connection. The initial point of contact for National Grid will be your allocated Customer Connection Contract Manager for your Bilateral Agreement.

What standards are required for energy storage devices?

Coordinated, consistent, interconnection standards, communication standards, and implementation guidelines are required for energy storage devices (ES), power electronics connected distributed energy resources (DER), hybrid generation-storage systems (ES-DER), and plug-in electric vehicles (PEV).

What if there is a dispute with the grid code?

In the event of dispute, the Grid Code and Bilateral Agreement documents will take precedence over these notes. Small and Medium Embedded Power Stations should contact the relevant Distribution Network Operator (DNO) for guidance. These Guidance Notes are based on the Grid Code, Issue 6, Revision 23, effective from the 22nd of April 2024.

Does national grid provide operating device numbers for electric service equipment?

Customers owning electric service equipment above 600V shall operate and maintain such equipment in accordance with Company supplied operating instructions and specifically ESB 755, "Operation and Maintenance Requirements for Services above 600V." If applicable, National Grid will provide operating device numbers for customer service equipment.

How do I protect a generator based on a user data file structure?

As part of the User Data File Structure content, the Generator should submit a Generator Protection Settings report together with an overall trip logic diagram. ROCOF protection should be disabled for directly connection and if islanding protection is required, an inter-tripping scheme is recommended.
