Can phosphorus be used in energy storage?

Phosphorus in energy storage has received widespread attention in recent years. Both the high specific capacity and ion mobility of phosphorus may lead to a breakthrough in energy storage materials. Black phosphorus, an allotrope of phosphorus, has a sheet-like structure similar to graphite.

Are phosphorus-based mesoporous materials suitable for energy storage and conversion?

In this article, we highlight recent advancements in the synthesis of phosphorus-based mesoporous materials for energy storage and conversion, including metal phosphates, phosphonates, and phosphides. The discussion is sectioned into three parts according to different synthetic approaches (i.e., soft-template, hard-template, and template-free).

Can black phosphorus be used in energy storage?

In this review, we outline recent research on the application of black phosphorus in energy storage. By the summary of several early reviews and the collation of related research fields, the important research progress of phosphorus, especially black phosphorus, in the field of electrochemistry is introduced.

Do phosphorus-rich metal phosphides show superiority in energy storage and conversion fields?

Phosphorus-rich metal phosphides show great superiority in energy storage and conversion fields. The up-to-date advances of phosphorus-rich metal phosphides are summarized and analyzed insightfully. The theory-composition/structure-performance relationships and the reasons behind the superior performance are revealed.

What are the applications of black phosphorus?

The application of black phosphorus in various application fields is introduced, including LIBs, SIBs, PIBs, magnesium-ion batteries (MIBs), LSBs, LABs, and supercapacitors. For LIB/SIBs, we conducted a detailed and extensive review based on the size of the phosphorus.

Is blue phosphorus stable?

Through the density functional theory (DFT) calculation on the basis of the model for a blue phosphorus monolayer on an Au (111) surface (Fig. 6 b), the calculated adsorption energy for each phosphorus atom is -0.27 eV, indicating that this blue phosphorus is stable [49].
