

How does vanadium ion concentration affect battery performance?

Vanadium ion concentration, supporting electrolytes concentration, environmental temperature, and even the difference between positive and negative solution can all impact the viscosity, thus influencing the battery performance.

What is a stable positive electrolyte for vanadium redox flow battery?

Stable positive electrolyte containing high-concentration $\text{Fe}^{2+}(\text{SO}_4)_3$ for vanadium flow battery at 50 °C *Electrochim. Acta*, 309(2019), pp. 148-156, 10.1016/j.electacta.2019.04.069 Google Scholar M. Ding, T. Liu, Y. Zhang, Z. Cai, Y. Yang, Y. Yuan Effect of Fe(III) on the positive electrolyte for vanadium redox flow battery

Are chloride ions an electrolyte additive for high performance vanadium redox flow batteries?

Chloride ions as an electrolyte additive for high performance vanadium redox flow batteries *Appl. Energy*, 289(2021), 10.1016/j.apenergy.2021.116690 Google Scholar M. Skyllas-Kazacos, L. Goh Modeling of vanadium ion diffusion across the ion exchange membrane in the vanadium redox battery

What is a suitable concentration of vanadium?

For the above reasons, the temperature window is limited in the range of 10-40 °C, with a concentration of vanadium limited to 1.5-2 M. Skyllas-Kazacos et al. recommended a suitable concentration of vanadium at 1.5 M or lower, and that the SOC should be controlled at 60-80 % when the concentration of ions was higher.

Can a mixed electrolyte stabilize vanadium ions?

In the early stages, Li et al. added the Cl^- into the vanadium electrolytes and proved that the mixed electrolyte can stabilize the vanadium ions up to 2.5 M over a temperature range of -5-50 °C, which could be attributed to the replacement of H_2O with Cl^- .

How to make electrolyte based on vanadium reduction and intermediate product synthesis?

By using two different ways, direct vanadium reduction (electrolyte from leachate) and intermediate product synthesis (electrolyte from leachate derived V_2O_5), the electrolyte was synthesized, which made by the second method could be comparable with the standard electrolyte.
