

Can storage technologies improve energy security in Romania?

Such enhanced legislation is needed for implementing the Romanian National Energy and Climate Plan (NECP), which lists 'developing storage capacities' as an instrument to improve energy security but lacks detail on how storage technologies will be deployed until 2030.

Does Romania need a strategy for energy storage?

Based on the EU context and planning a significant uptake of renewable energy sources in its electricity mix over the following decades, Romania must also develop a strategy for the deployment of energy storage technologies.

Is ETES a viable solution for the Romanian energy sector?

With only one ETES large-scale facility currently operating in Hamburg, Germany, there is significant potential for replication. Versatility and scalability make ETES a solution for increased flexibility in the Romanian energy sector.

What are some examples of energy security issues in Romania?

One example is Romania's NECP, which at first did not address storage technology. The updated version of 2020 was marginally improved in this respect, listing 'developing storage capacities' as an instrument to improve energy security, but lacking detail on the storage capacity to be developed until 2030.

Can Romania Invest in clean generation technologies?

To be able to invest in clean generation technologies, the Romanian energy sector must first address its network adequacy issues. Several solutions ought to be considered, ranging from grid reinforcement and expansion, interconnections, storage, decentralised production, and software-based solutions -- demand response, IoT, aggregators, etc.

Why does Romania need a new energy system?

The Romanian energy system is currently highly dependent fossil fuels, centralised, and to a good extent technically obsolete, being in serious need of overhaul in order to sustain the upcoming energy transition.
