

Supercapacitor devices are currently used in EVs to transform energy from regenerative braking systems, since the high power density of supercapacitors allows them to charge and discharge more rapidly than batteries. Supercapacitors cannot yet replace lithium-ion batteries in terms of energy storage, although the technology is improving every year.

The high power capability of supercapacitors are ideal for IoT devices which require efficient energy storage but need pulses of energy for communications. Supercapacitors provide small form factor storage that last 2-4 times longer than batteries with high power density and no thermal runaway risk.

These solutions, based on power and control electronics, meet the energy manageability needs with regard to generation, distribution and consumption.
