

Teknoware central battery system Trinidad and Tobago

What is a Teknoware central battery system?

Teknoware's range of central battery systems starts with small systems containing just a few dozen luminaires and a single central battery unit up to centrally controlled systems containing thousands of luminaires.

What solutions does Teknoware offer?

Both centrally supplied and self-contained solutions are available. We also supply a unique fibre optic Low Location Lighting system based on our own Optiline(TM) fibre. Teknoware also manufactures a range of central battery systems. In addition to the standard features, there is also available an automatic addressable testing system.

How does Teknoware IC work?

Teknoware's IC (Intelligent Controller) system enables a large amount of different options, to turn the non-maintained emergency lights ON and OFF, by using voltage inputs, which can be freely chosen. At the same time, the voltage of several fuse boxes or general lighting can be monitored.

Do Teknoware luminaires need separate data cabling?

The testing of the luminaires is based on individual addresses, and the communication is by means of the power supply cables. Thus, there is no need for any separate data cabling between the luminaires. The luminaires must be addressable, of the Teknoware products with the letter K in the end, or they must have a separate address module.

The 31 and 41 central battery units are an easy and economical solution for supplying a relatively small number of luminaires in a limited area. These systems are especially suitable for properties and premises where the system is to be divided into several independent areas. The 31 system has 4 output circuits.
